

# Water, warmth and light

Plants need water, warmth  
and light to live.

Plants flop over when they need water.

Plants stop growing  
in winter when it is cold.

Plants do not grow  
where there is no light.

We stand flowers in water  
if we want them to last.

A rose taken out of  
water soon flops over.  
This is called wilting.

Plants grow well in summer when it is warm and the Sun can shine a long time each day.

Many plants do not grow in winter. It is cold and the Sun does not shine very long each day.

**When do plants grow best?**
