

Magnetic and transparent

Some materials, like magnets and glass, are special.

A magnet is a material that is pulled towards iron and steel. A magnet does not pull other materials, such as wood or stone.

This magnet is picking up pieces of steel.

Magnetic letters hold on to a steel fridge door.

How could you test paper to see if it was a magnetic material?

You can see through glass.

Glass is called a transparent material.

You can see through the glass in a window.

You can see the milk in this glass.

A magnifying glass is a special shape of glass that lets you see things bigger.
