

# Wind and water

Wind and water push on things and make them move.

The wind makes a kite fly.  
It makes a ship sail.

A very strong wind is called a hurricane.  
It can knock over trees and houses.

Moving water is very powerful, too.

The wind makes a flag flutter.

A hurricane smashes up houses.

The wind makes the sails push the ship forwards.

A fast river carries these canoeists along.

Moving water makes a waterwheel turn.

**What happens to trees when the wind pushes on them?**
