

# Life in a park

A park is a mixture of wildlife and things we have grown.

Most of the ground in a park is covered in grass.

In places there are bushes, flower beds and also many different trees. These are often grouped together.

There are large areas of grass in a park.

It's easy to see lots of different flowers in a park.

Butterflies move from flower to flower.

Spiders weave their webs in the bushes.

Woodlice live under rotting branches.

Most of the wildlife in a park is small. Many of the animals are insects such as ants and butterflies. There will be some larger animals such as squirrels and birds, and there may be ducks on a pond.

Larger animals, such as foxes, come out at night when there are no people about.

**Which are easier to see in a park – plants or animals?**
